

Welcome

General is for creating topics and configuring the bot. A working topic is a conversation with your OpenCodez agent.

Press **New topic**, check the title and model, create the topic, and start writing.

The default name is a random Old Russian word. Another word draws again; Title lets you enter your own. Disable the mode in Settings.

FILES collects files. AUDIO turns voice notes and audio files into text. You can finish these connections later.

Topic creation example: the full model ID is visible and actions stay close together. The working topic remains a clean conversation.

Topics and profiles

A profile saves the model, reasoning, and optional System and agent. Create, copy, edit, delete and restore profiles in General → Profiles.

The catalog comes from the selected OpenCodez server. Models are grouped by provider and family. Search accepts names and IDs.

Saving a profile does not change running sessions. New topics use the selected settings.

`/new` opens the wizard. `/new sol Title` remains a quick creation command.

Everyday work

Send your prompt in its topic. Attach images or files. Files without captions wait for your next text message.

Command	Action
/session	Model, status and OpenCodez link
/q prompt	Send or queue a prompt
/q status	View the queue
/kill	Stop and clear the queue
/compact	Compact an idle session

The bot shows agent text and final answers. Ordinary tool actions are hidden by default.

/q delete N removes a queue item by number. Agent questions use buttons; work continues after your answer.

Reset and rewind

`/reset` starts a new session in the same topic, keeping its profile, server and directory. The previous session remains in OpenCodez.

`/reset solm` also selects another profile.

Replying to an earlier user prompt rewinds that turn. The bot discards the later branch and submits your reply in place of that prompt. This is not ordinary quoting.

`/context` exports recent completed or interrupted turns. `/context 1` exports one. Internal compaction and reminders do not count as separate prompts.

Save your `/context` depth in personal settings or with `/set_context N`, from 1 to 10.

Files and audio

FILES receives results the agent sends at your request. Drop a file there to save it on the configured server; the bot returns its path.

AUDIO transcribes voice notes and audio files. Copy the text and send it to the agent yourself.

A transcript never starts an agent automatically.

Connect Groq through Setup. Whisper Large V3 Turbo is recommended. The free tier has limits.

Spoken answers are a separate setting. Reply `/speak` to an answer for a one-off voice summary when providers are configured.

Settings and notifications

Final-answer, question and failure alerts arrive in your private chat. Open the bot and press Start once. Final-answer notifications can be disabled in settings.

`/setup` checks connections and continues unfinished setup. Running it again does not recreate service topics.

Language, tool visibility and voice options are in General → Settings. `/update` checks bot updates.

The General panel moves to a fresh message daily. `/menu` moves it to the bottom immediately.
